Dear Adding Technology Hiring Team,

I am writing to apply for the Junior Java (Spring Boot) + Angular + PL/SQL developer role. My backend experience with Java and Spring Boot is a direct match for this position, and I want to be upfront about the one gap: my front-end work has been in React rather than Angular. I pick up frameworks quickly and would welcome the chance to prove that on the job.

Here is how my experience maps to the role:

- Java and Spring Boot backend development: I built an event-driven ticketing platform with Spring Boot 3 and Apache Kafka, and a Spring Boot REST API with JPA and PostgreSQL persistence for a separate project.
- Relational databases: Across both projects I designed and queried PostgreSQL schemas directly, the same relational-database skill set the role asks for with PL/SQL.
- Independent delivery in a small team: My Final Degree Project, a native Android app unifying Valencia's public transport data, required me to reverse-engineer undocumented public APIs on my own, from first design decision to final grade of 9/10.

Adding Technology's focus on custom digital-transformation solutions, from SaaS products like Taxi Adding and Projectify to broader business-process digitalization, is exactly the kind of varied, hands-on engineering work I am looking for. A small, specialized team is also where I do my best work: I like being able to see a feature through from technical discussion to delivery.

I am a self-directed learner who picks up new stacks outside of formal requirements, and I am comfortable working autonomously once I understand the codebase and its conventions. I would welcome the opportunity to bring that adaptability to your Angular front end.

I look forward to hearing from you.

Kind regards,

Álvaro López Álvarez
