Dear Bending Spoons Hiring Team,

I am writing to apply for the Graduate Software Engineer role. My background spans an LLM agent built with LangGraph, event-driven microservices in Kafka, a distributed Function-as-a-Service platform in Go, and an HTTP server built directly on raw sockets, work that reflects the kind of end-to-end ownership and toolkit versatility this role calls for.

What draws me to Bending Spoons specifically is your model of acquiring established products, Evernote and WeTransfer among them, and operating them for the long term with small, talent-dense teams rather than growing headcount for its own sake. That structure rewards exactly the instinct I bring to my own projects: question the complexity in front of you before adding more of it.

My experience maps directly onto what the role asks for:

- Ownership from idea to production: As an R&D Developer at ITI, I took an open-ended problem, natural-language queries against a sensitive data-governance schema, to a working LangGraph agent with schema selection, structured SQL generation, and retry-on-error.
- A toolkit that spans languages and layers: I've shipped a distributed FaaS platform in Go, event-driven microservices in Java and Kafka, and full-stack features in React and TypeScript, choosing the tool the problem called for rather than defaulting to what was familiar.
- First-principles systems work: outside coursework and internships, I built an HTTP/1.1 server directly on raw TCP sockets and a tree-walking interpreter from scratch, simply to understand what frameworks usually hide.
- Working across a team, not just a codebase: as a Full-Stack Developer Intern at ITI, I built frontend features in React and TypeScript while coordinating closely with the backend team so both sides stayed integrated.

I am a self-directed learner: I take on projects like these because I want to understand how something works underneath, not because a course requires it, and I hold myself to a high bar for correctness rather than stopping once something merely runs. I am finishing my Master's degree part-time (expected September 2026) and am available to spend the initial months in the Milan office as the role requires.

I look forward to hearing from you.

Kind regards,

Álvaro López Álvarez
