Dear Health in Code Team,

I am applying for the Java Developer position in Valencia. I have just completed my Master's Degree in Computer Engineering at UPV (8.8/10), focused on distributed systems, and I would like to build backend services for a company that, with its own platforms such as DataGenomics, turns genomic data into diagnoses for personalized medicine.

Here is what I bring to your team:

- Spring Boot and Kafka: I built an event-driven microservices platform with the outbox pattern, dead-letter topics, idempotent processing, and integration tests with Testcontainers.
- RESTful APIs and databases: I have built REST APIs with JSON exchange over PostgreSQL, both in Java (Spring Boot, JPA) and in Go. At ITI, I developed an agent that generates validated SQL to resolve data-access policies.
- Front-end collaboration: at ITI I built React and TypeScript features integrated with back-end services, so I know what a front-end team needs from an API.

To be clear, my Java, Spring Boot, and Kafka experience comes from my own personal projects, not from a professional role. I build them because I genuinely enjoy learning: when a technology interests me, I pick a project and build it until I understand it. GraphQL, Kubernetes, and hexagonal architecture, which I have not used yet, are next on that list.

I would welcome the opportunity to discuss how I can contribute to your Application Development team.

Kind regards,

Álvaro López Álvarez
