Dear Mimacom Hiring Team,

I am writing to apply for the Java Software Engineer (RD3) role. I bring hands-on Java and Spring Boot backend experience alongside genuine React front-end skills, the exact combination this role asks for, and I am confident I can contribute to your client project from day one while continuing to grow.

My background maps directly onto what the role needs:

- Java and Spring Boot in production-style systems: I built an event-driven ticketing platform with Spring Boot 3 and Apache Kafka, including an outbox pattern, dead-letter topics, and Testcontainers integration tests.
- React front-end delivery: At ITI, I shipped new front-end features in React and TypeScript for the company's internal Intranet application, working directly alongside the backend team to keep both sides in sync.
- Investigating and resolving real issues: As an R&D Developer at ITI, I built a multi-step agent that validates and safely retries generated SQL queries, work that depended on tracing bugs back to their root cause under real data constraints.

What drew me to Mimacom specifically is the breadth of your engineering work, from Kafka-based event-driven systems to enterprise clients across banking, retail, and manufacturing. Having built my own Kafka-based platform, I would welcome the chance to apply that experience to your client projects, and to keep growing my React skills alongside colleagues who already work across this stack daily.

I am a fast, self-directed learner: outside of formal coursework, I have built projects ranging from a language interpreter to a Retrieval-Augmented Generation pipeline, simply to understand how the underlying technology works. I am comfortable investigating unfamiliar code, asking for support when needed, and collaborating closely with a team, and I am fluent in both Spanish and English.

I look forward to hearing from you.

Kind regards,

Álvaro López Álvarez
