Dear N26 Hiring Team,

I am writing to apply for the Junior Backend Engineer - Lending role in the Financial Empowerment domain. I bring two backend and full-stack roles at ITI, Java fundamentals built through a self-directed Spring Boot and Kafka project, and a track record of managing my own priorities and delivering independently, all of which map directly onto what this role asks for. I am available to start immediately.

What draws me to this role is the Financial Empowerment domain's mission: giving people access to the money they need, today or tomorrow, so they can build financial freedom. I want to be upfront that I am based in Valencia and am specifically looking for full-remote junior roles, so I wanted to raise that early rather than later in the process.

Here is how my experience maps to the role:

- Java and event-driven basics: I have been building a ticketing platform with Spring Boot 3 and Apache Kafka as a self-directed project, learning producer/consumer patterns and event-driven microservice design hands-on.
- Kotlin from native Android development: I designed and shipped ValenMove, a native Android app (Kotlin, MVVM) unifying Valencia's public transport into one interface, including reverse-engineered public APIs for real-time data.
- Independent delivery under an ambiguous spec: at ITI, I designed and built an autonomous agent that turns natural-language questions into validated, read-only SQL against a data-governance schema, owning the scope, safety validation, and retry logic with minimal day-to-day oversight.

I investigate unfamiliar code readily and ask for input when it counts. I welcome direct feedback on my code as much as I give it, and I look forward to collaborating with N26's international engineering team on the Lending roadmap. I work comfortably in English and Spanish and am direct about progress and blockers.

I would welcome the opportunity to discuss how I can contribute to the Financial Empowerment team's backend work.

Kind regards,

Álvaro López Álvarez
